### Abstract

Research in public policy and public administration employ a variety of methodological and statistical approaches. Survey research, secondary data analysis, and field experiments are in use today. Often policy questions are studied over time and/or across states and communities. Researchers are becoming increasingly aware of the problem that one unit of analysis, an individual or a community, may be nested within another unit.

The presentation will cover topics under investigation by faculty and PhD students at UNLV and the potential for collaboration.
