

The Amount of Stress this Career Entails is Significant

Any persons interested in a career in this field should acknowledge that the type of work forensic scientists do entails high amounts of stress. Part of this stress is due to case overloads. Technicians are constantly getting overloaded because the rate of crimes being committed outweighs the rate of crimes being solved. They could be working on a case for many months, even years, before they can come to a conclusion based on the evidence they interpret. Another reason for the high stress is due to the importance of accuracy in their work because the analyses that they give could be life changing in many criminal cases.
