OVERVIEW

Collegicoin is a new education based cryptocurrency looking for a C++/blockchain developer.

Collegicoin is a new cryptocurrency that intends to help fix a major problem with higher education, cost. It is a student-centered coin that will allow students to have more control over their college expenses.

As a proof-of-work coin with masternodes, students will be able to mine their own coins and/or invest in a masternode to help create passive income. They will then be able to use these coins at online establishments like textbook rental companies, university bookstores, and school supply stores. We also hope to work with colleges and universities to give students the option to pay for part of their tuition with Collegicoin.

Collegicoin will also have something that helps set it apart from other coins – yearly scholarships for students! Not only will they be able to create their own passive income, they can compete for a scholarship that will give them another way to save on their education.

Roles and Responsibilities
You will report directly to the owner and will be responsible for maintenance of our current blockchain as well as creating mobile apps/wallets.
